This allows you to use your Mac as a terminal connected to a host computer directly or through a modem. The emulators support video attributes and graphic characters sent from the host computer.

The program includes a phone list, a dialer for Hayes-compatible modems and on-screen programmable function keys. It can scroll back through the past 20 pages of data.

This supports the CommToolBox, allowing connections to networks running Ethernet, Appletalk, TCP/IP, Text, Xmodem, Ymodem, Zmodem, Kermit and FTP.
